# The Importance of Water

By: Donald S. Robertson, M.D. and Carol Robertson

Incredible as it may seem, water is quite possibly the single most important catalyst in losing weight and keeping it off.

Water suppresses the appetite and helps the body metabolize stored fat. Studies have shown that a decrease in water intake will cause fat deposits to increase while an increase in water intake can actually reduce fat deposits.

Here's why – The kidneys cannot function properly without enough water. When they do not work to capacity, some of the load is dumped onto the liver. One of the liver's primary functions is to metabolize stored fat into usable energy for the body. But, if the liver has to do some of the kidney's work, it cannot work at full throttle. As a result, it metabolizes less fat: more fat remains stored in the body and weight loss stops.

Drinking enough water is the best treatment for fluid retention. When the body gets less water, it perceives this as a threat to survival and begins to hold on to every drop. Water is stored in extra cellular spaces (outside the cells). This shows up as swollen feet, hands, and legs. Diuretics offer a temporary solution at best. They force out stored water along with some essential nutrients. Again, the body perceives a threat and will replace the lost water at the first opportunity. Thus, the condition quickly returns. The best way to overcome the problem of water retention is to give your body what it needs – plenty of water. Only then will stored water be released.

Water helps maintain proper muscle tone by giving muscles their natural ability to contract and by preventing dehydration. It also helps prevent the sagging skin that usually follows weight loss.

Water helps rid the body of waste. During weight loss the body needs a lot more water to get rid of all that metabolized fat.

How much water is enough? On the average, a person should drink eight (8-oz.) glasses every day. However the overweight person needs an additional glass for every 25 lbs. of excess weight. To utilize water most efficiently during weight loss, follow this schedule:

Morning: One quart over a four hour period.

Noon-Late Afternoon: One quart over a four hour period.

\*\*\*\*\*

**Another rule of thumb: Drink ½ your body weight in ounces or at least one glass per hour until early evening. Example: 200 lbs. = 100 oz. of water a day.**

*Please give your body what it needs to shed stored fat....WATER!!!*

# What Symptoms To Expect When You Improve Your Diet

By Dr. Stanley S. Bass, N.D., D.C., Ph.D.

If I were asked which is the area of greatest misunderstanding and confusion in the field of nutrition, I would definitely be forced to reply, it is the failure to properly understand and interpret the symptoms and changes, which follow the beginning of a better program.

A better nutritional program is the introduction of foods of higher quality in place of lower quality ones. The quality of a nutritional program is also improved by omitting toxic substances such as coffee, tea, chocolate, tobacco, salt, pepper, etc.

Remarkable things begin to happen to the body as well as the mind. When the quality of the food coming into the body is of higher quality than the tissues, which the body is made of, the body begins to discard the lower grade materials and tissues to make room for the superior, which it uses to make the newer and healthier tissues.

What are the symptoms or signs, which become evident when we first begin to omit the lower grade foods and instead introduce superior foods? When the use of a toxic is suddenly stopped, headaches are common and a letdown occurs. This is due to the discard by the body of toxins, which are transported by the bloodstream during its many bodily rounds. Before the noxious agents reach their final destination for elimination, these irritants register in our consciousness as pain or headache. Usually, within three days the symptoms disappear and we feel stronger due to the recuperation which follows.

As one continues on the improved diet and gradually raises the quality, interesting symptoms begin to appear. The body begins a process called "retracing." The cellular intelligence has a chance to get rid of old garbage and build a beautiful new house. The accent is on elimination and the body begins to move garbage deposited in the tissues.

People may experience skin rashes or eruptions due to elimination of poisons and harmful drugs through the skin. If they go to a doctor not familiar with this aspect of nutrition, he might diagnose it as an allergy and suggest the diet be discontinued. They don't understand that the body is "retracing." The skin is getting more alive and active. These toxins being discarded are saving you from more serious disease, which will result if you keep them in your body too much longer. Possibility: hepatitis, kidney disorders, blood disease, heart disease, arthritis, nerve degeneration, or even cancer. With some, colds may occur, or even fever. THIS IS NATURE'S WAY OF HOUSE CLEANING. Understand that those actions are constructive, even though unpleasant at the moment. DON'T try to stop these symptoms by the use of certain drugs. These symptoms are part of a cleansing process. These are not deficiency conditions or allergic reactions.

Symptoms may include: headaches at the beginning, fever and/or colds, skin breakouts, bowel sluggishness, occasional diarrhea, tiredness, nervousness, irritability, negativity, etc. Some people are not affected by the cleansing process at all ... if you are, BEAR WITH IT!
